

Greers Ferry Tailwater Versus the World: a Meta-analysis and Comparison of Brown Trout Spawning

Doug Zentner, Steve Lochmann, and Jonathan Spurgeon

Brown Trout Around the World

- Spread to coldwater fisheries across the globe
- Heavily studied species (papers 1910-20s)
- Data can be used to predict spawning times and places

Brown Trout in Arkansas

- **Introduced species within tailwaters**
- **Tailwaters less studied than natural streams and rivers**
- **Self sustaining in Greers Ferry Tailwater (GFTW)**

Brown Trout in Arkansas

- Introduced species within tailwaters
- Tailwaters less studied than natural streams and rivers
- Self sustaining in Greers Ferry Tailwater (GFTW)
- Economically valuable fisheries in Arkansas

Objectives

The objectives of this study are to:

- 1) Compare spawning times from the literature to GFTW**
- 2) Establish generalized spawning suitability curves using literature data**
- 3) Compare curves to measurements from GFTW**

Objectives

The objectives of this study are to:

- 1) Compare spawning times from the literature to GFTW**
- 2) Establish generalized spawning suitability curves using literature data
- 3) Compare curves to measurements from GFTW

Spawning Times

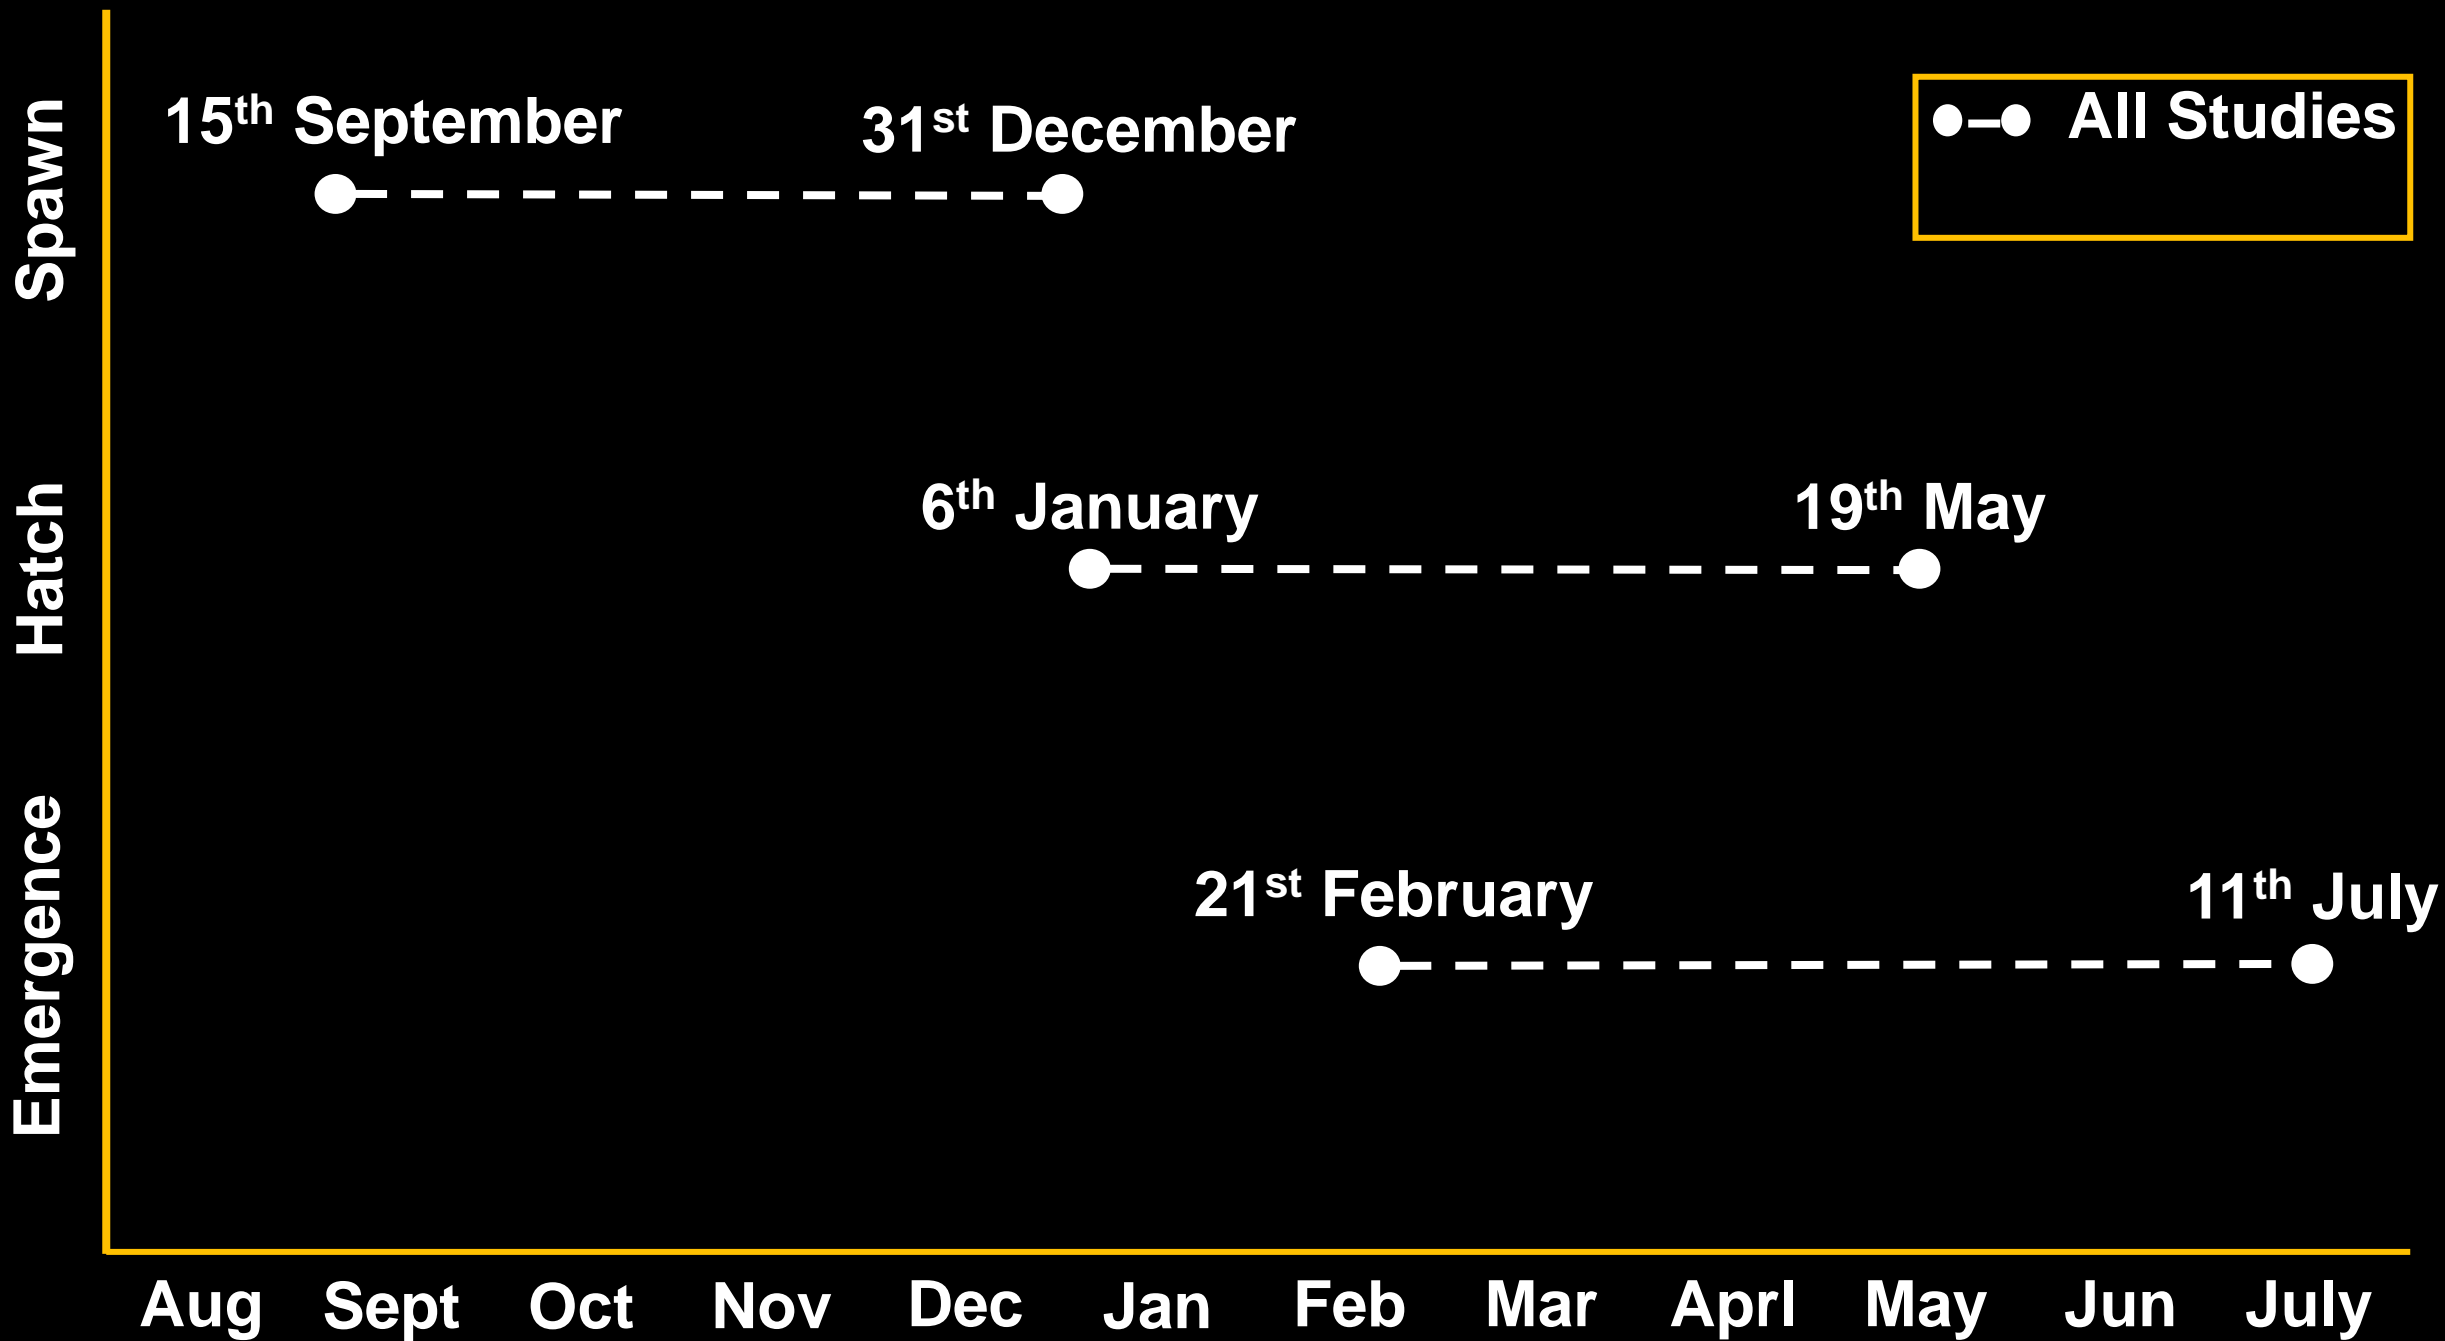

- Lots and lots and lots and lots and lots of reading
- Compared times across the globe to times in Arkansas
- Looked at what the GFTW can add to this

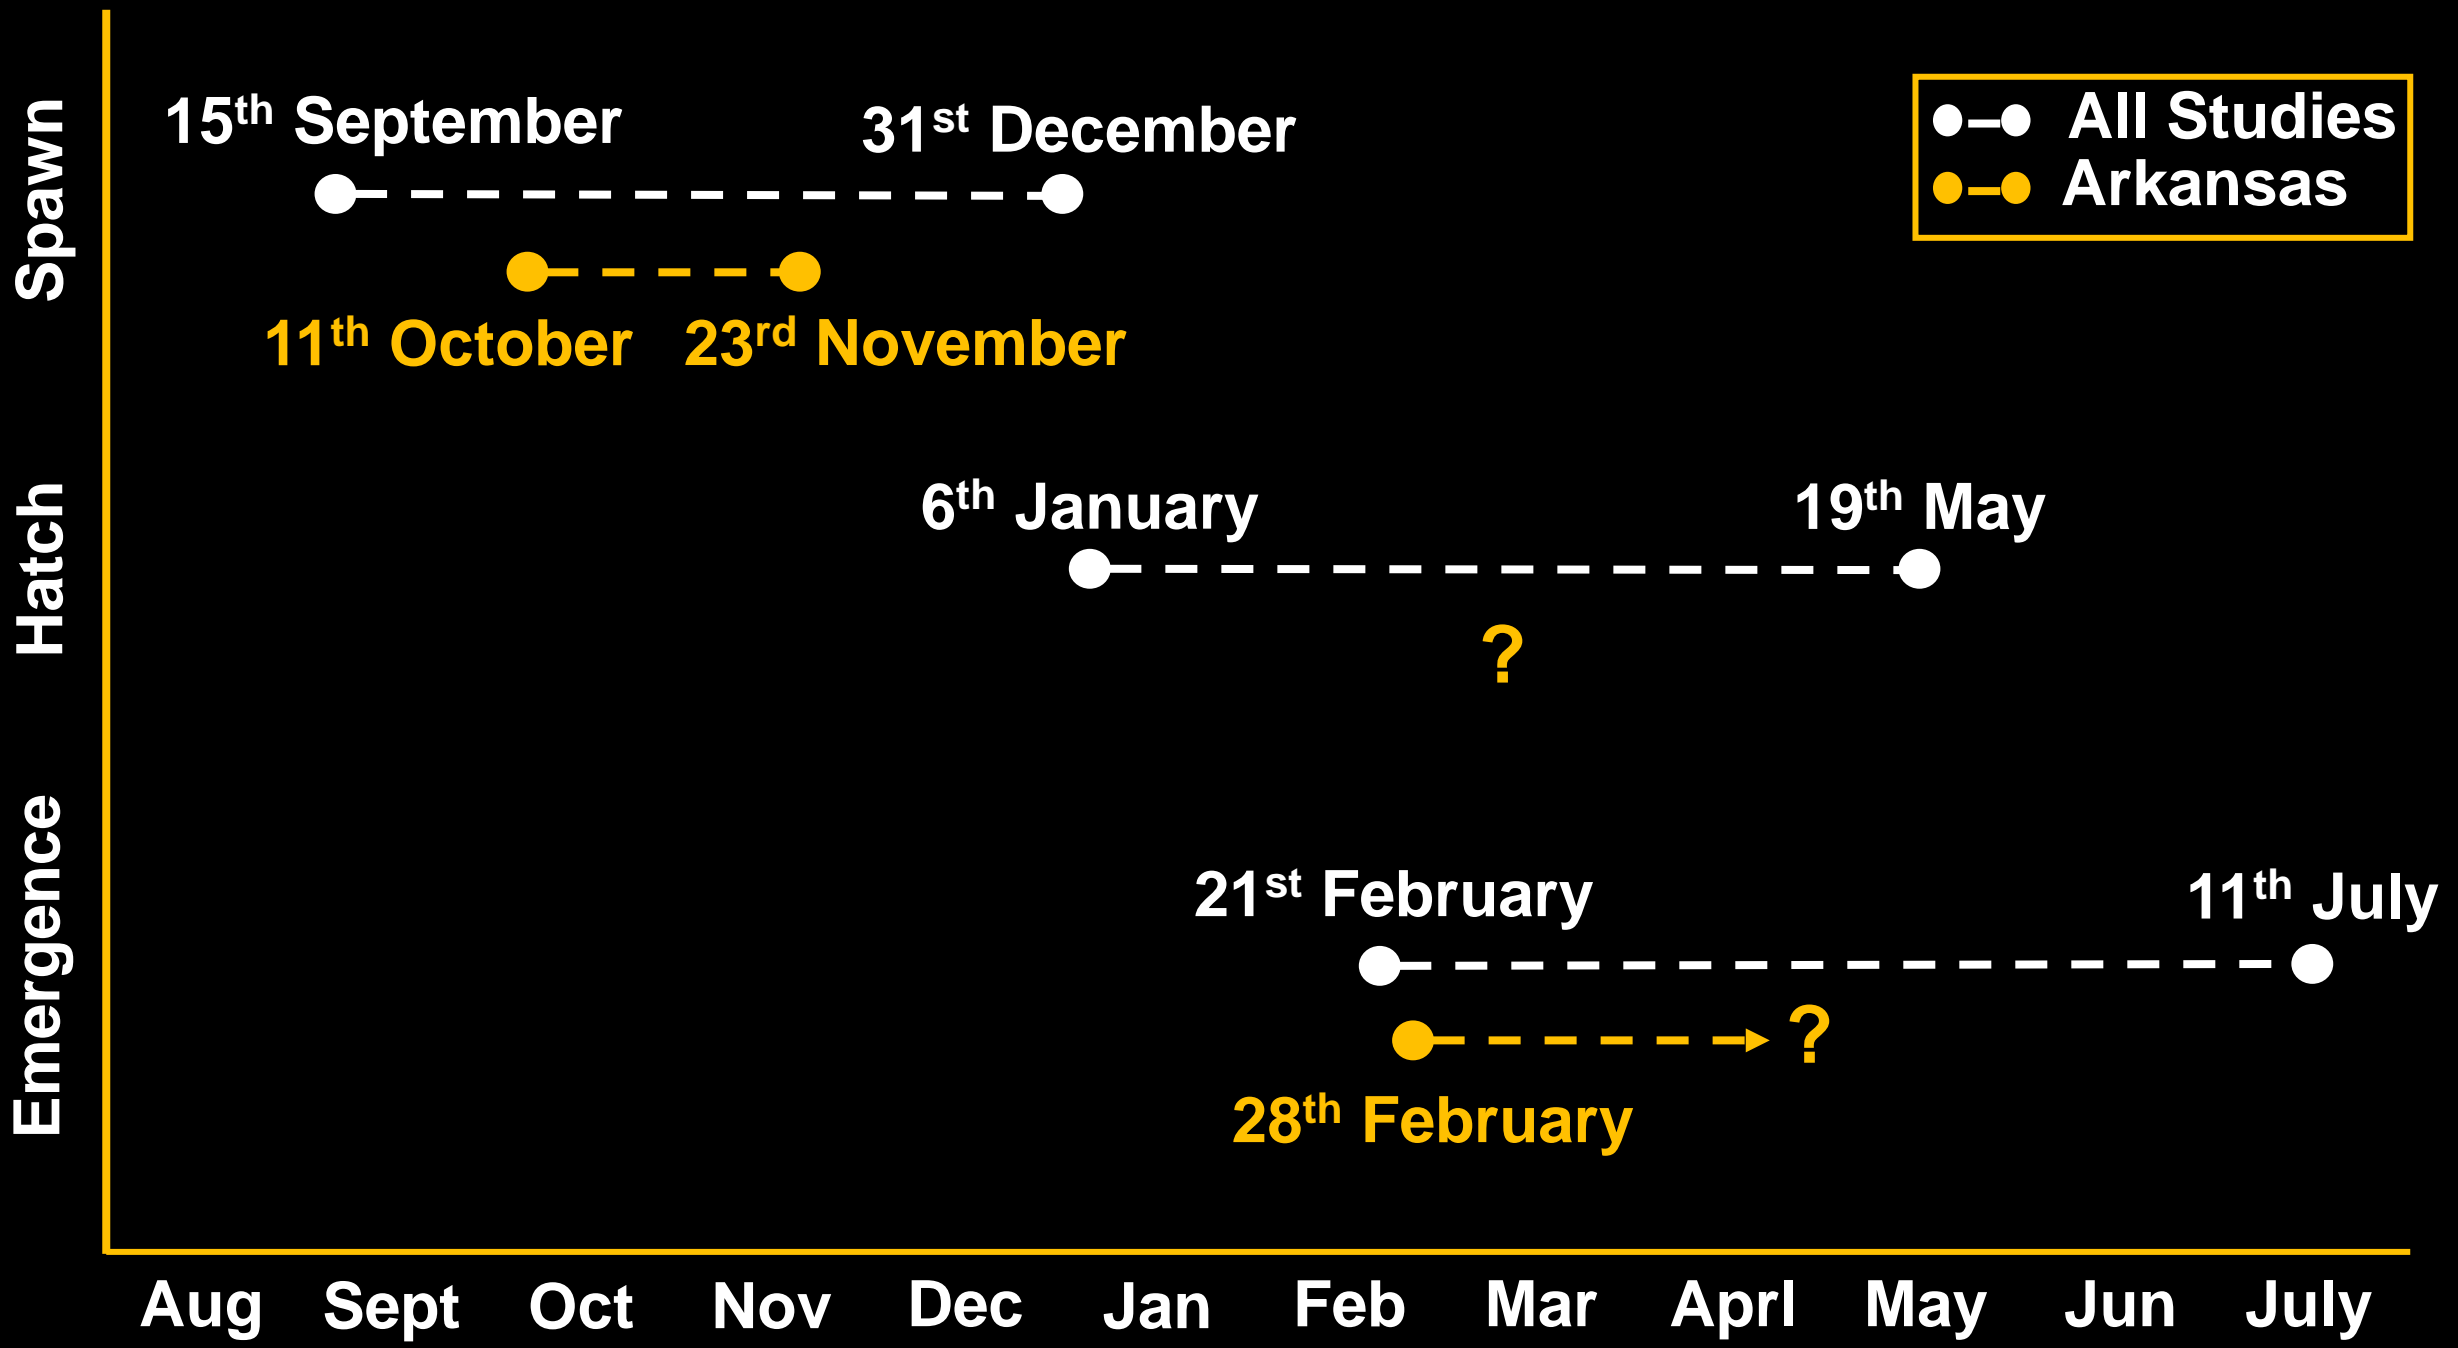

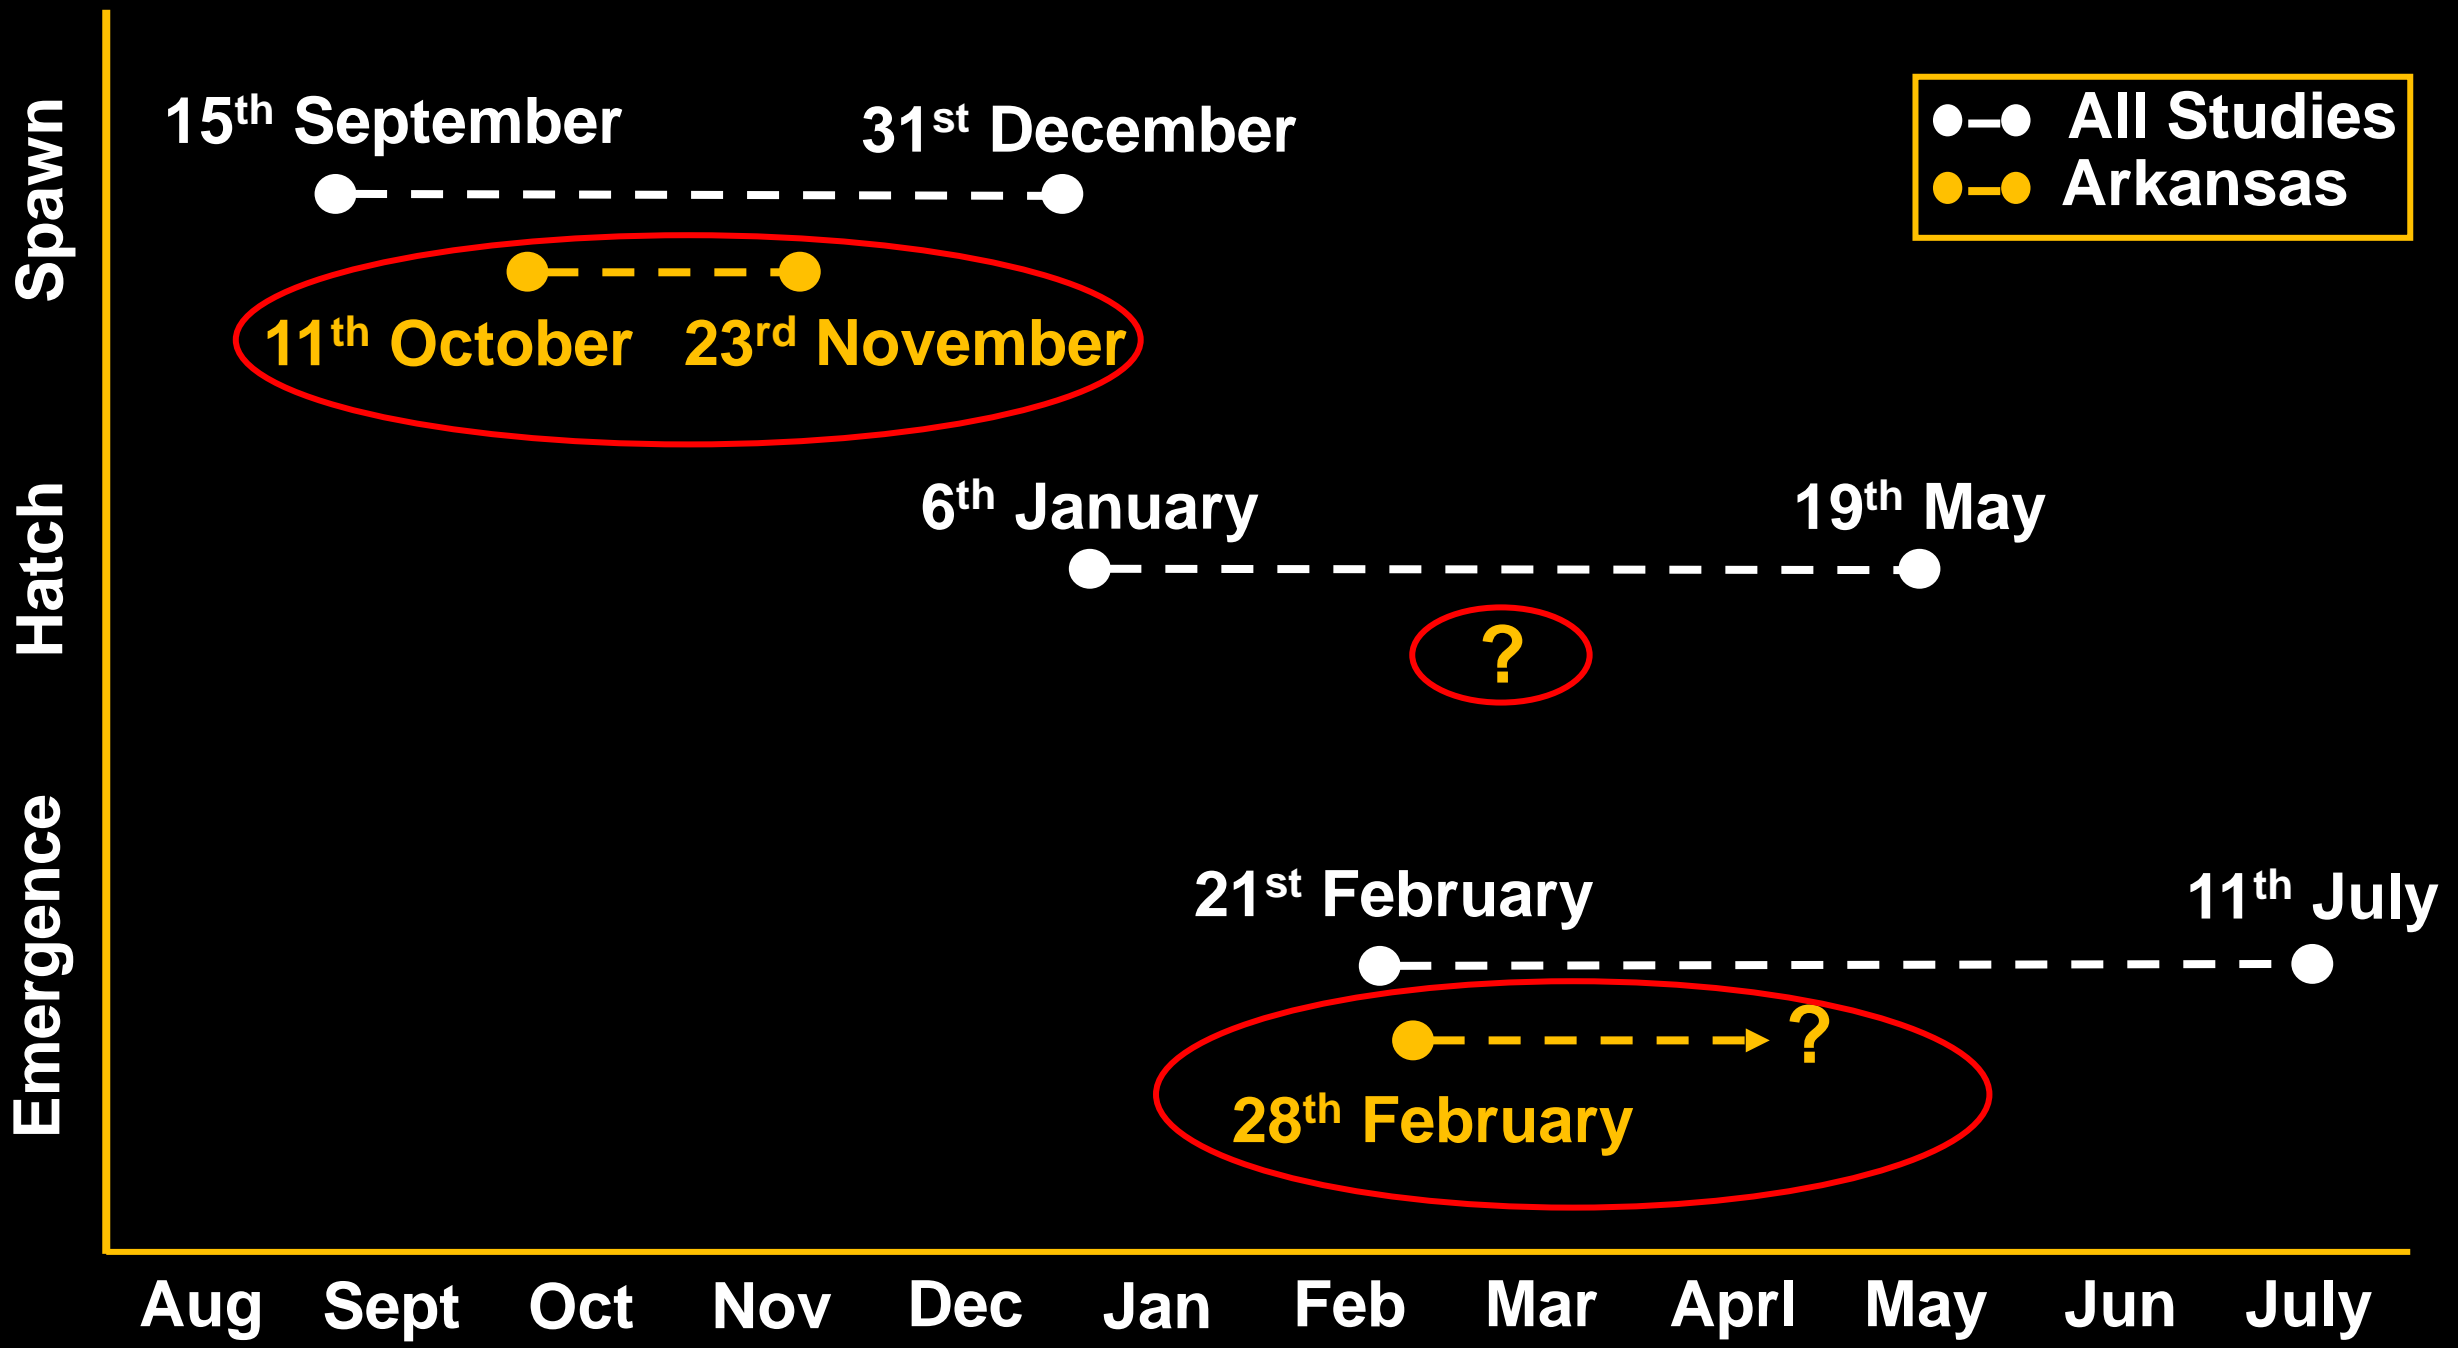

Spawning Times

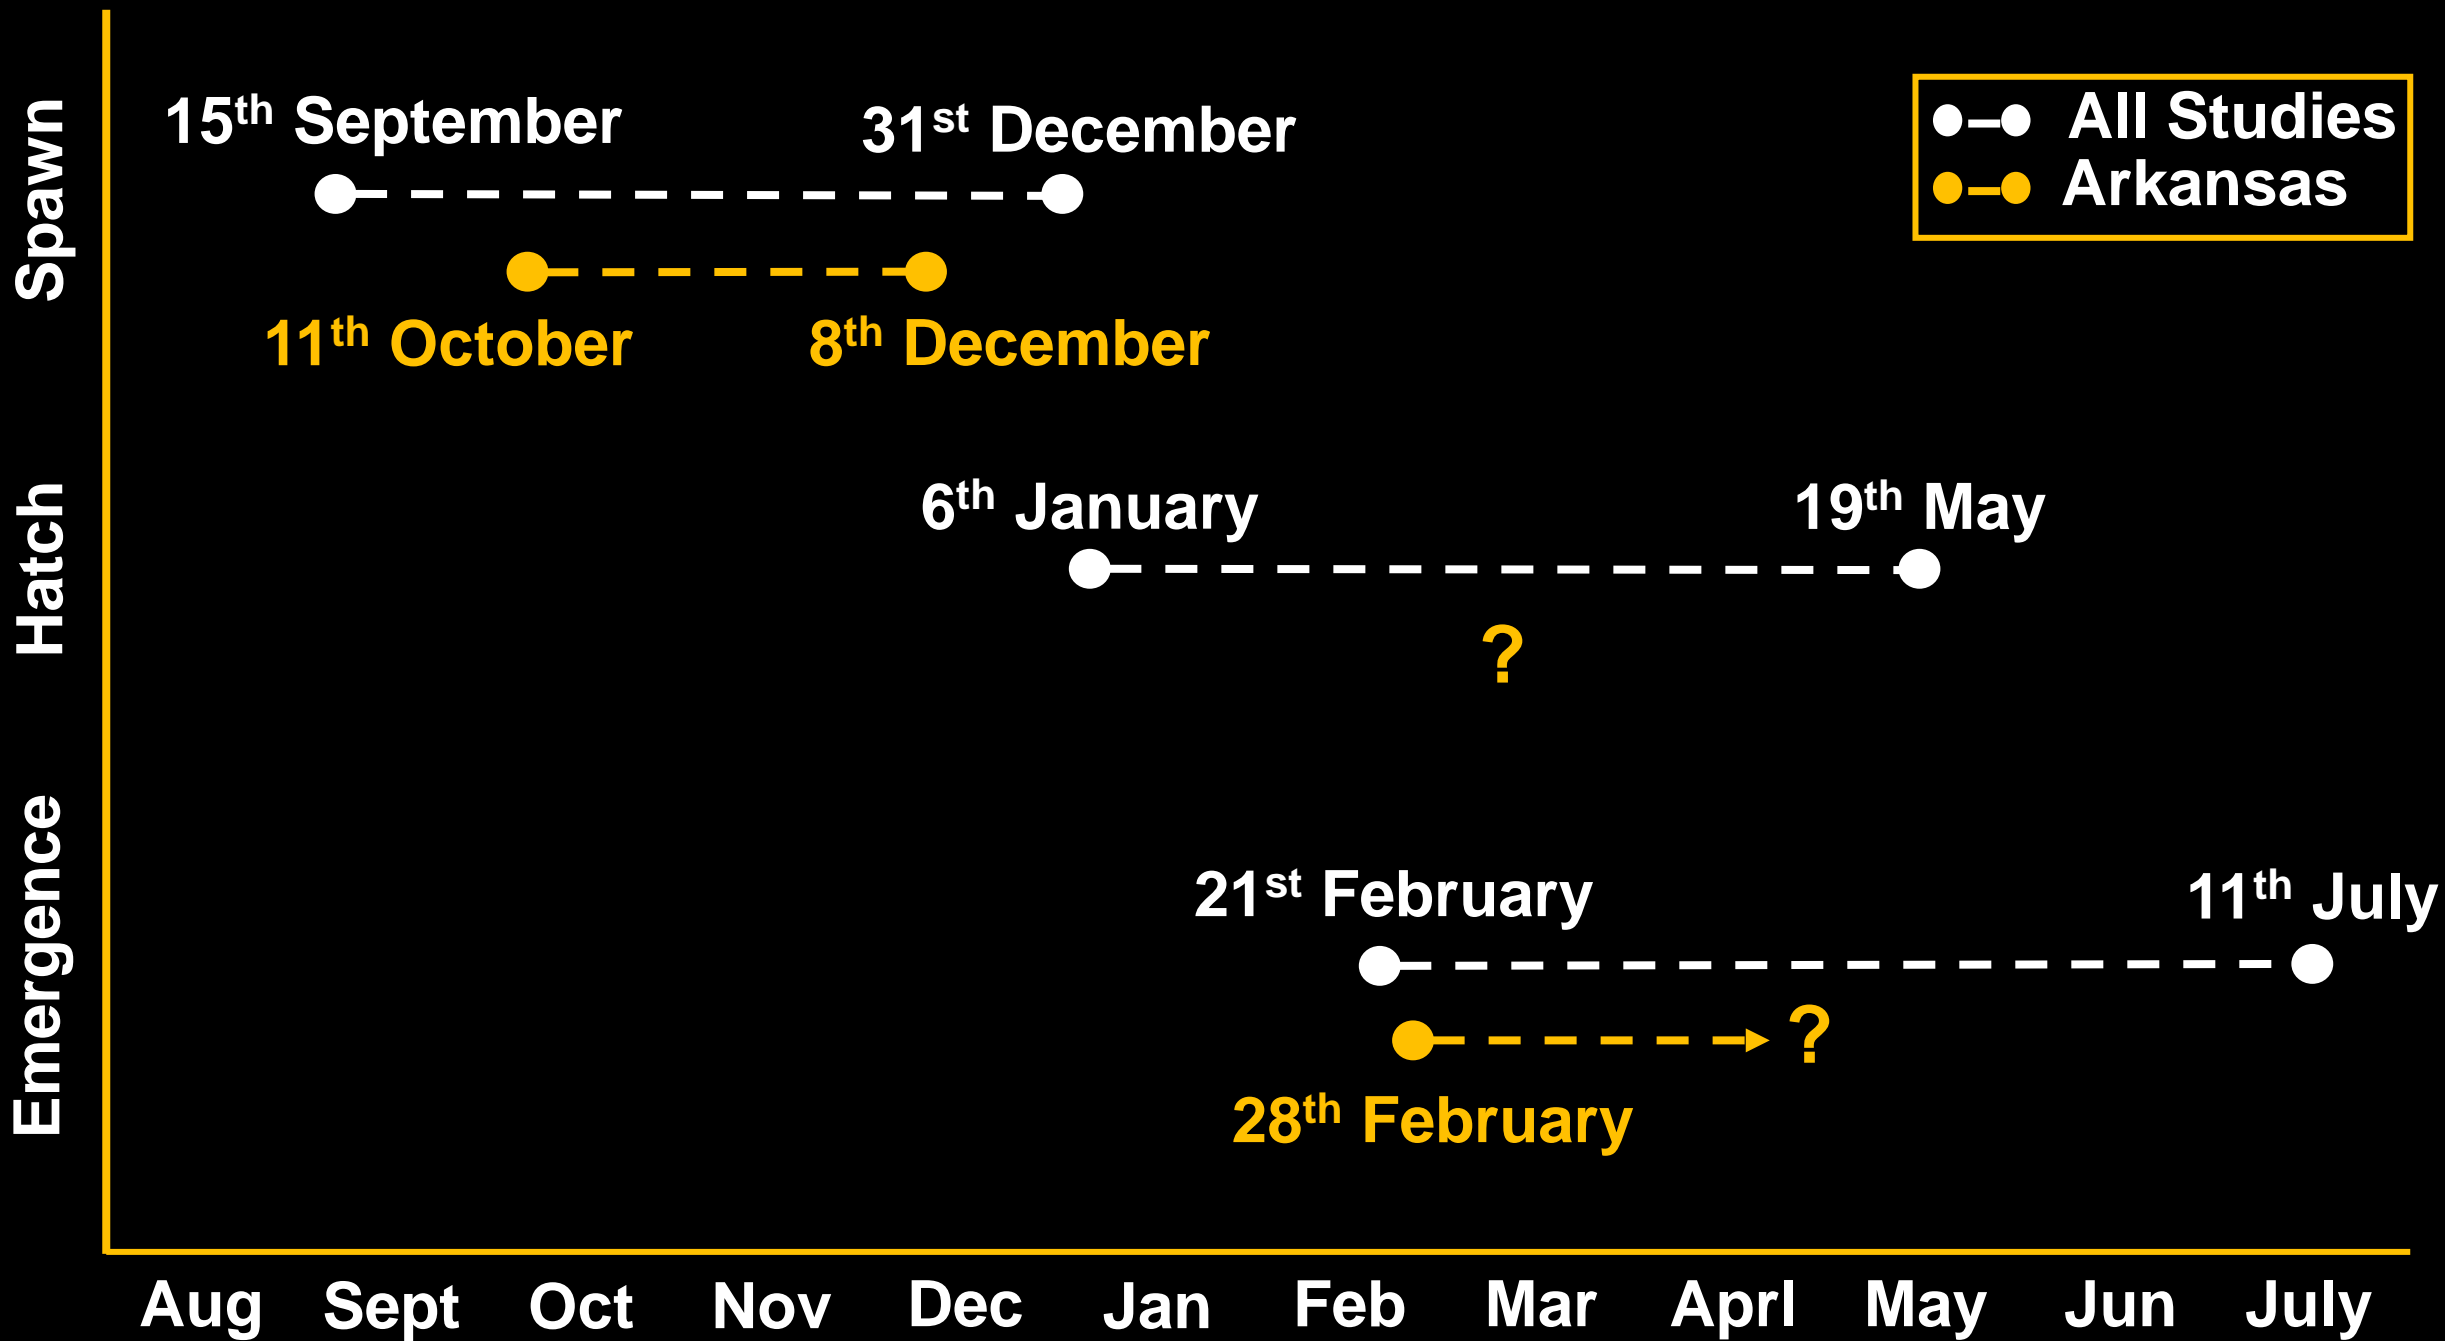

- Lots and lots and lots and lots and lots of reading
- Compared times across the globe to times in Arkansas
- Looked at what the GFTW can add to this

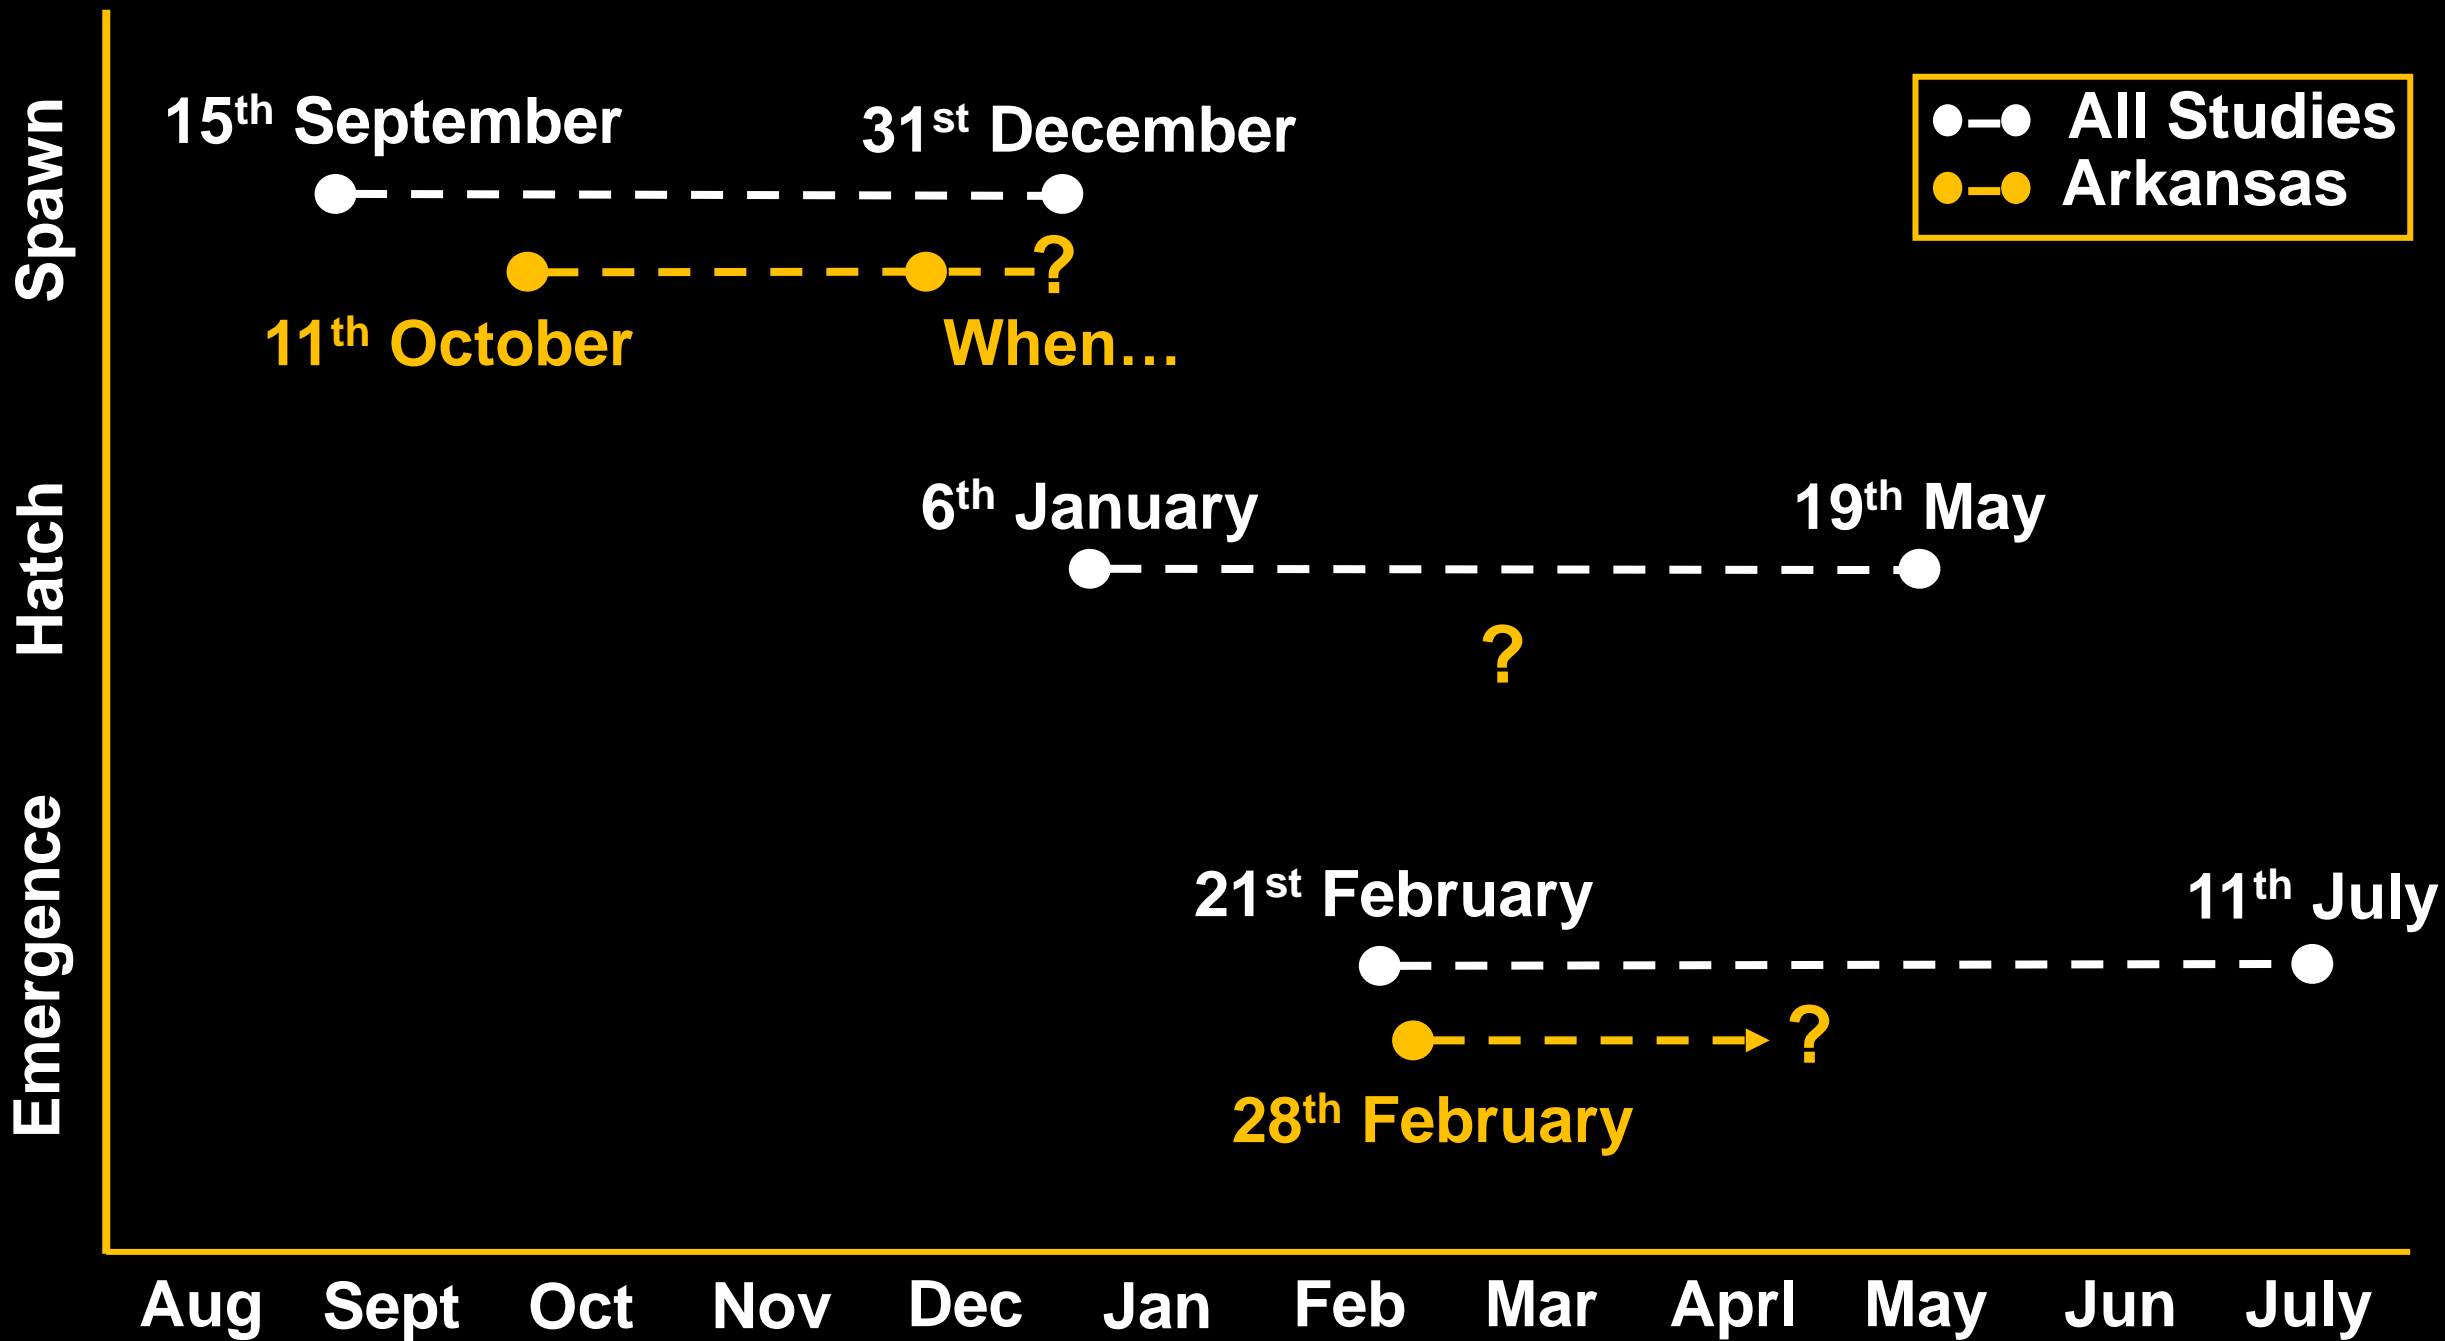

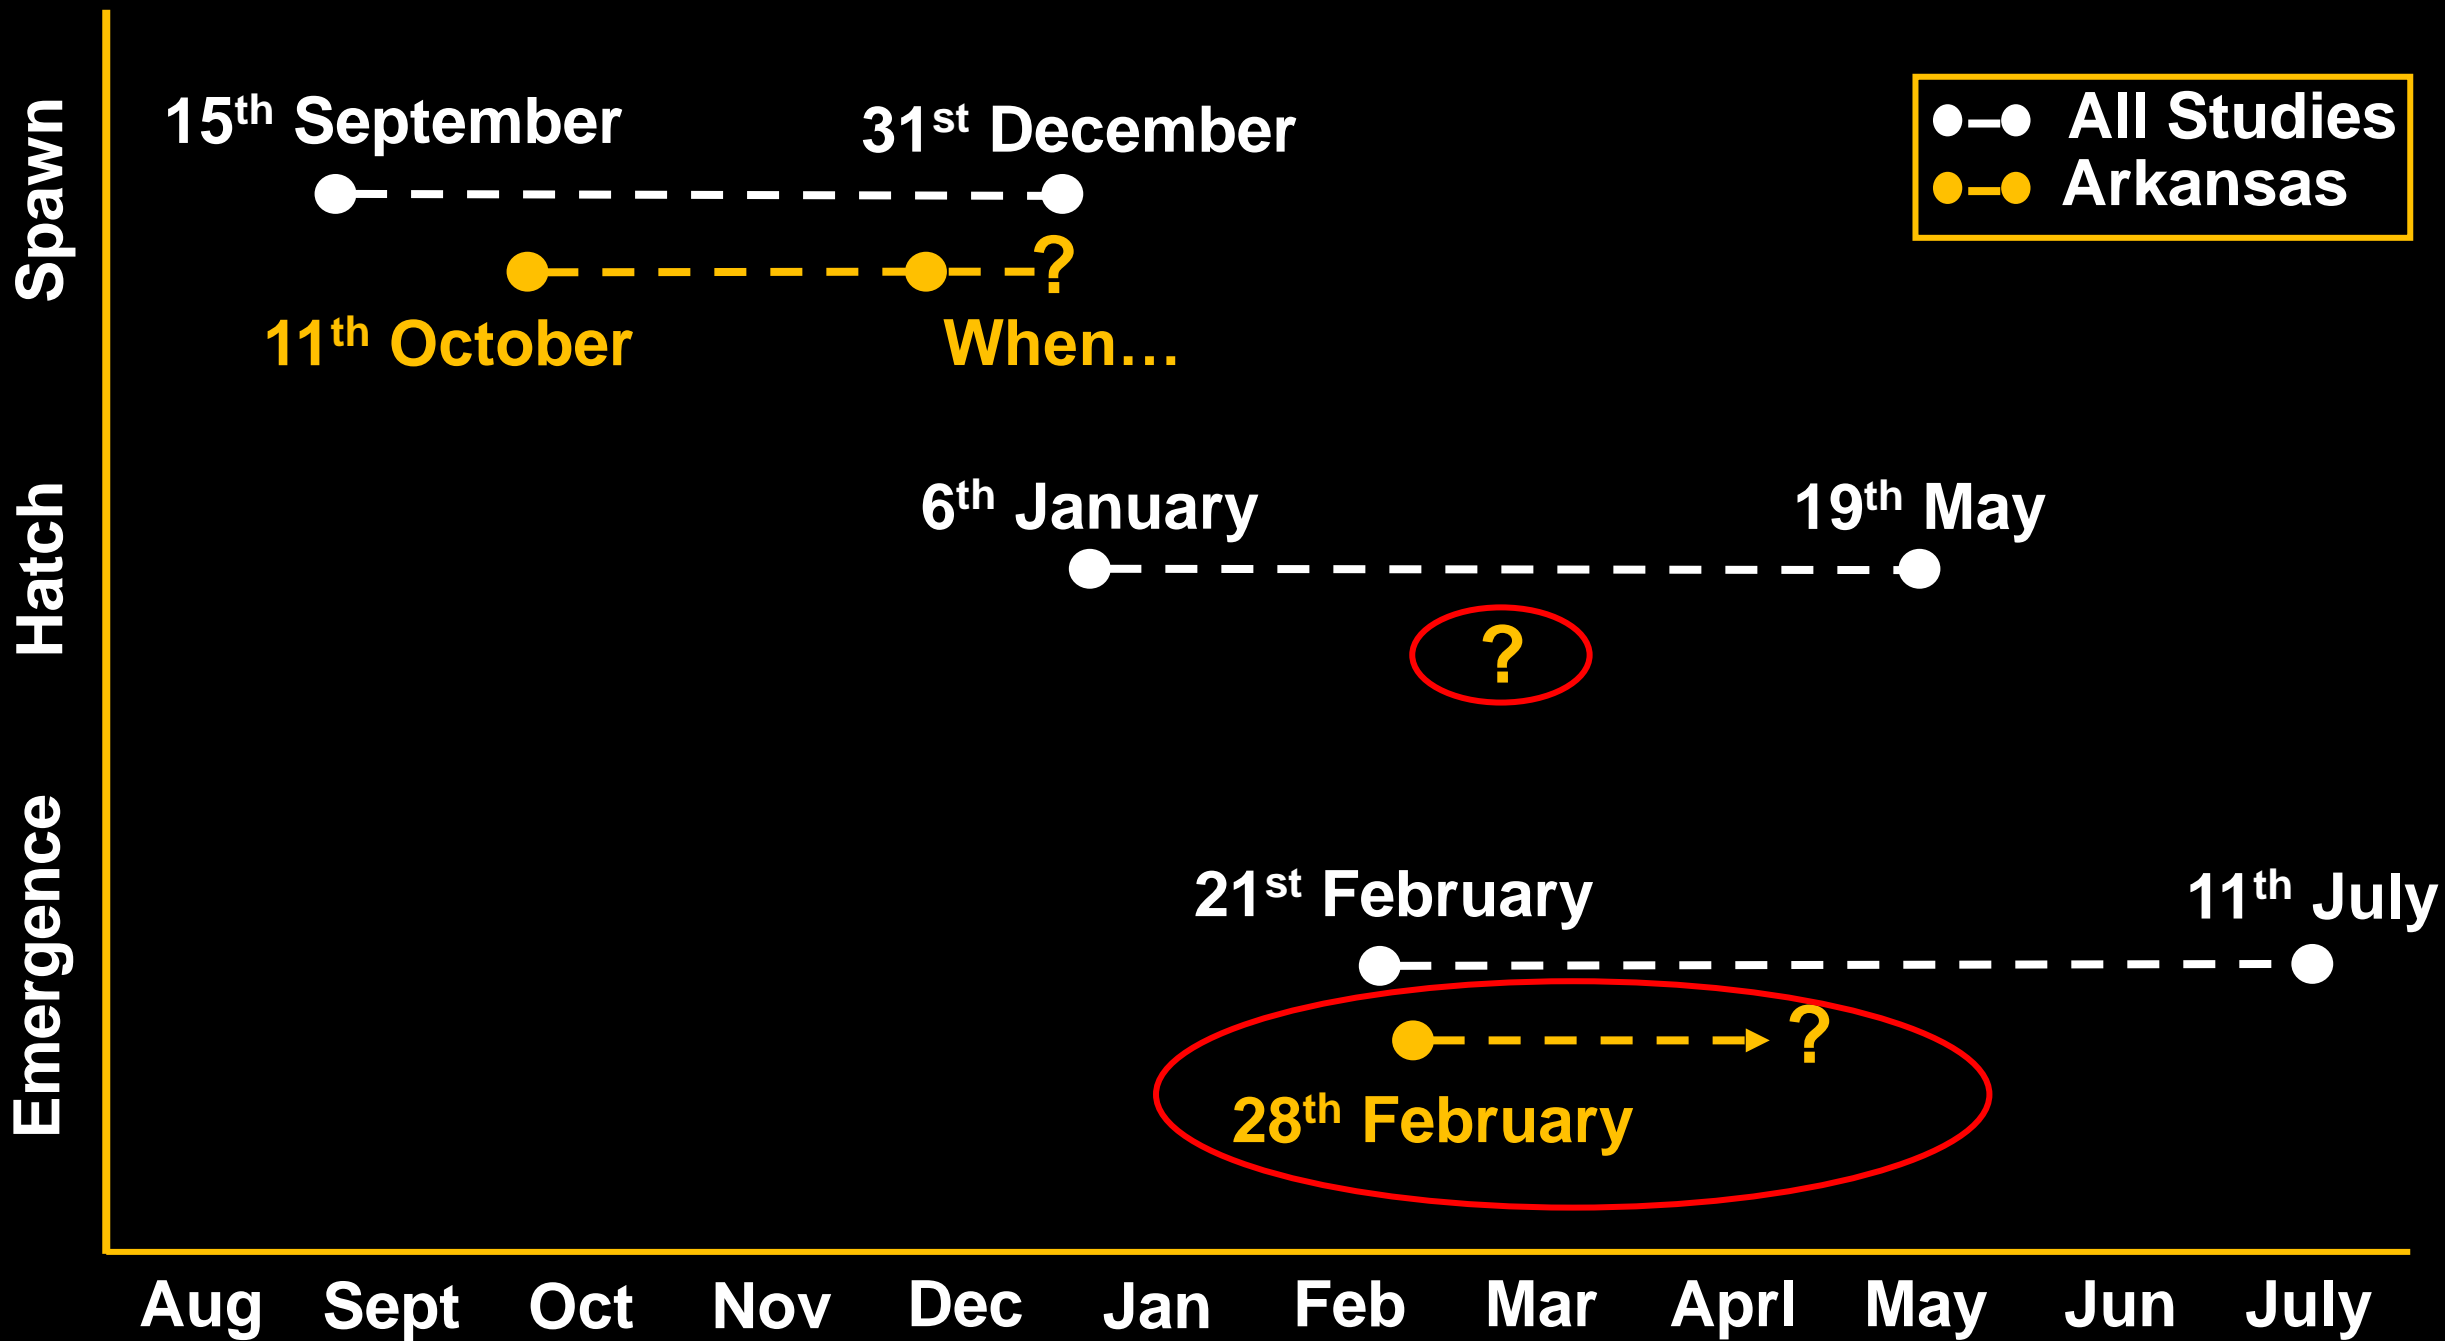

Objectives

The objectives of this study are to:

1) Compare spawning times from the literature to GFTW

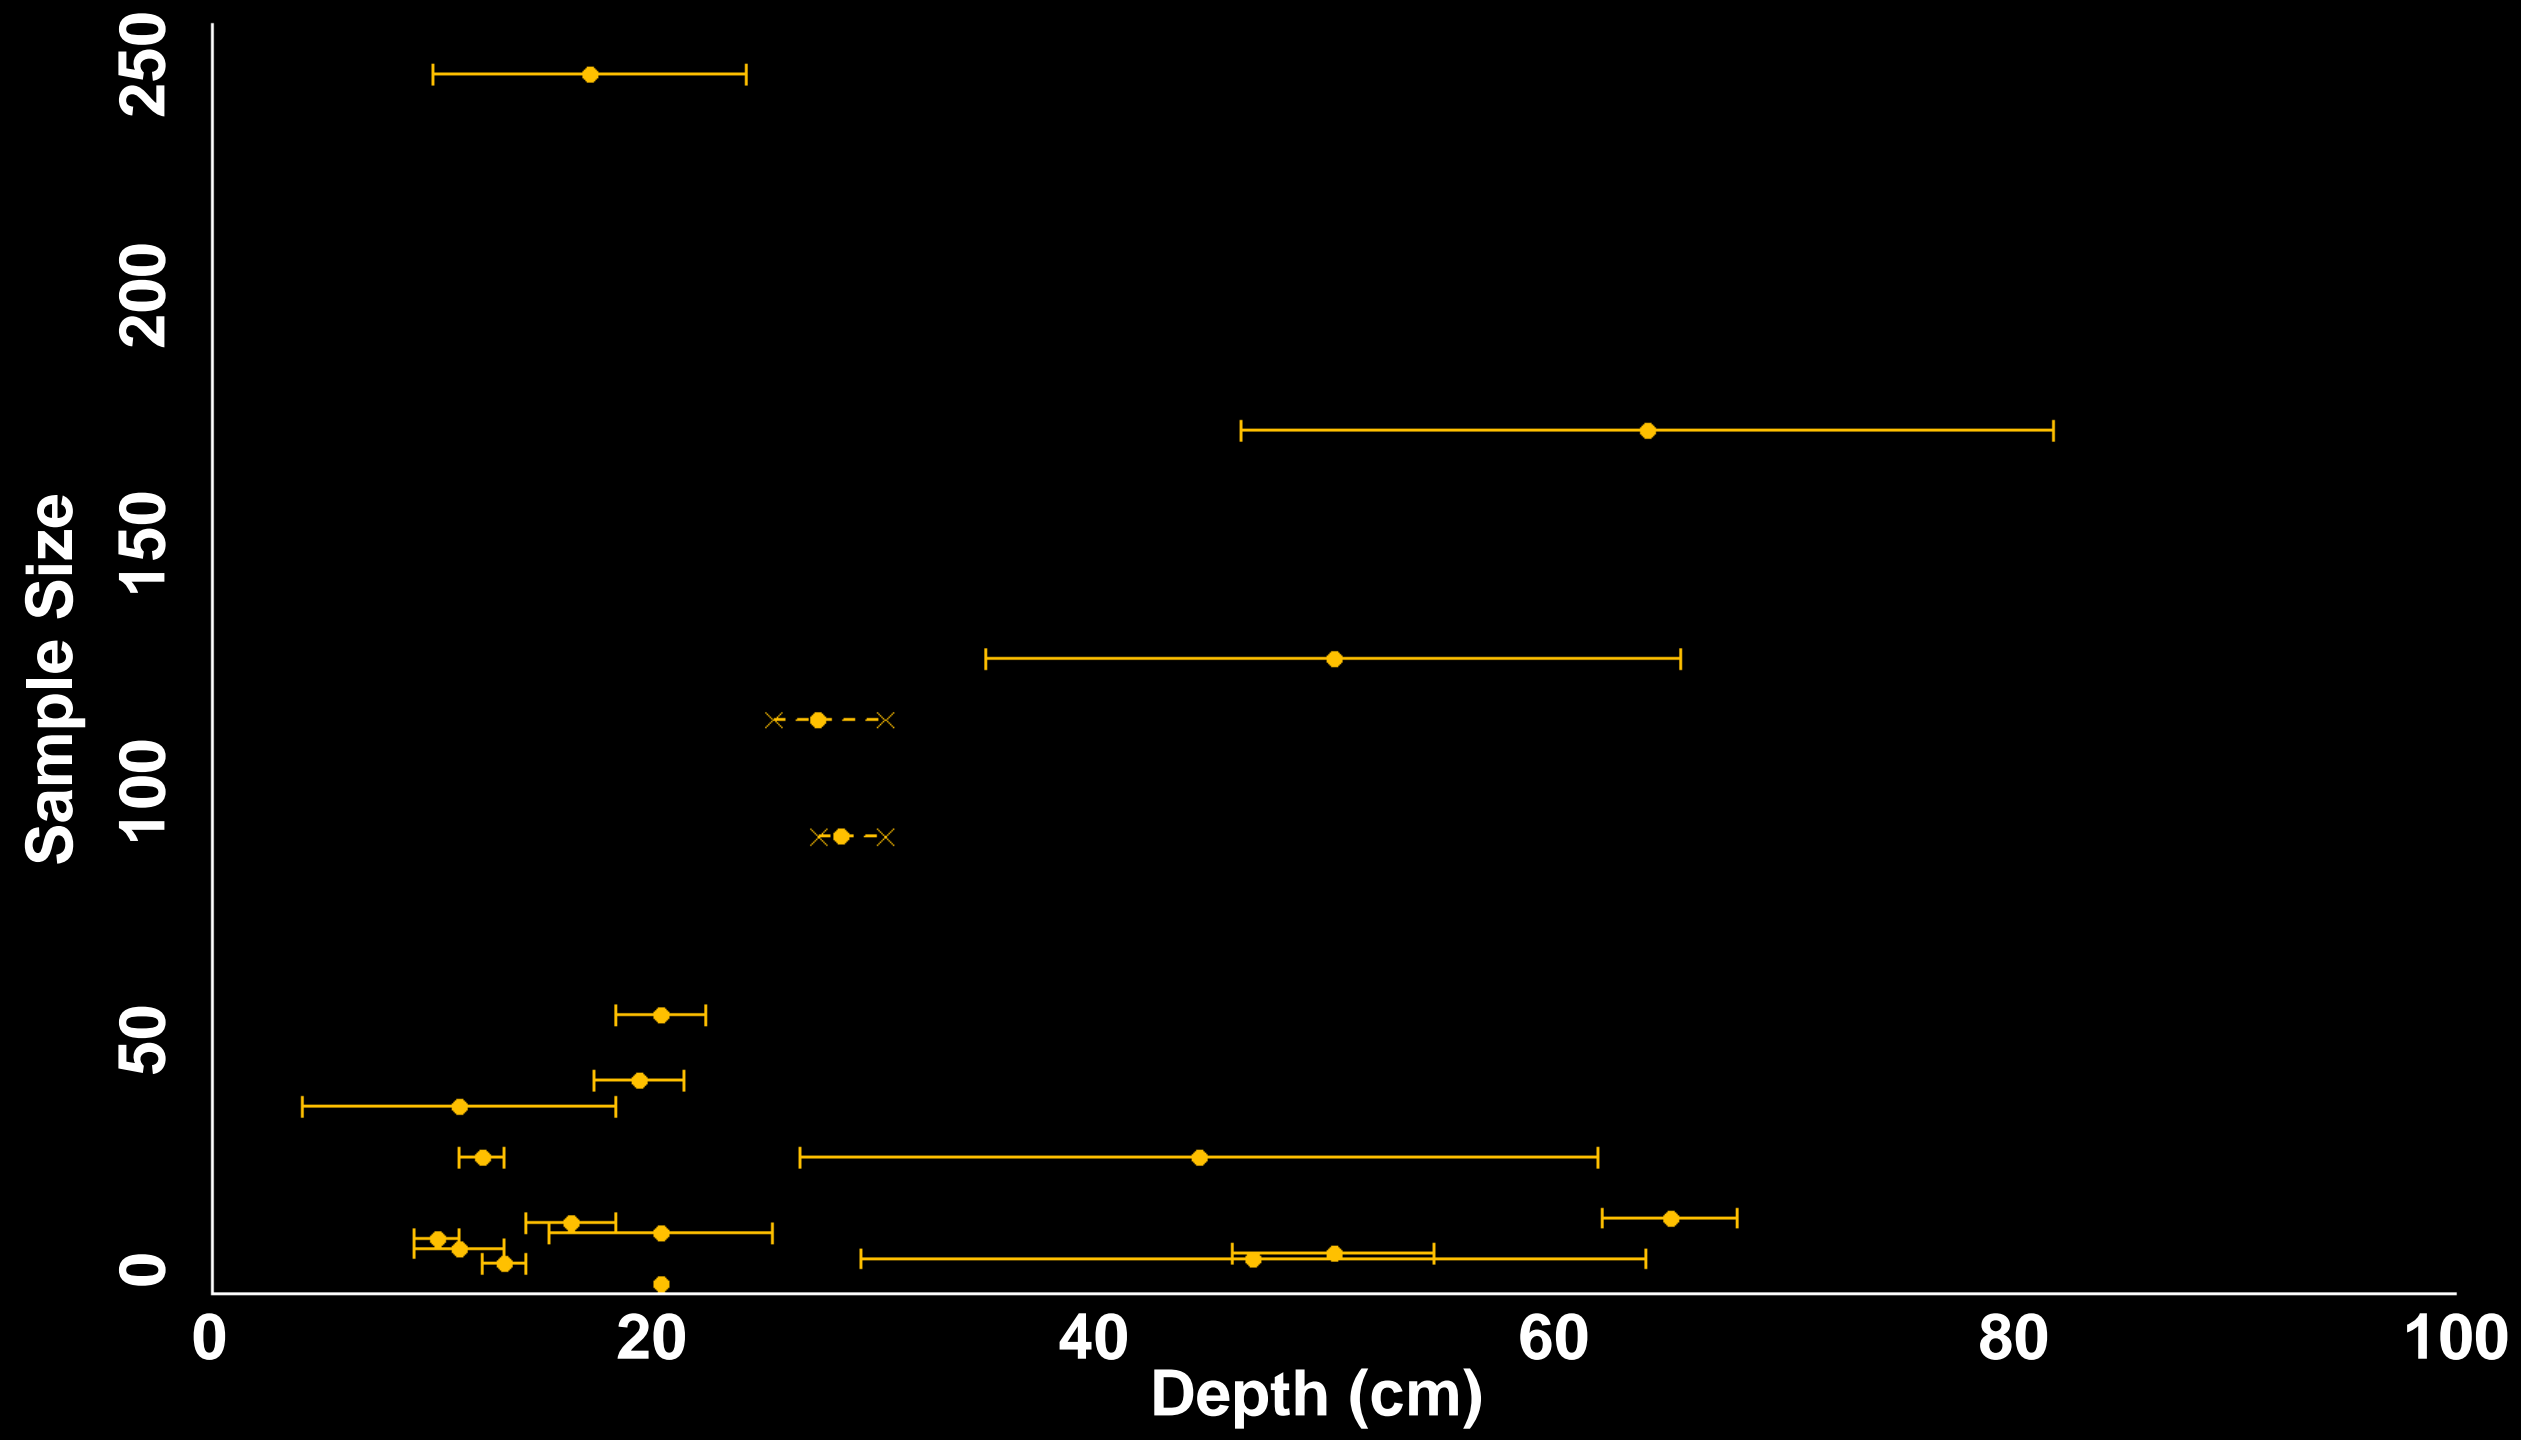

2) Establish generalized spawning suitability curves using literature data

3) Compare curves to measurements from GFTW

Suitability Curves and Comparison

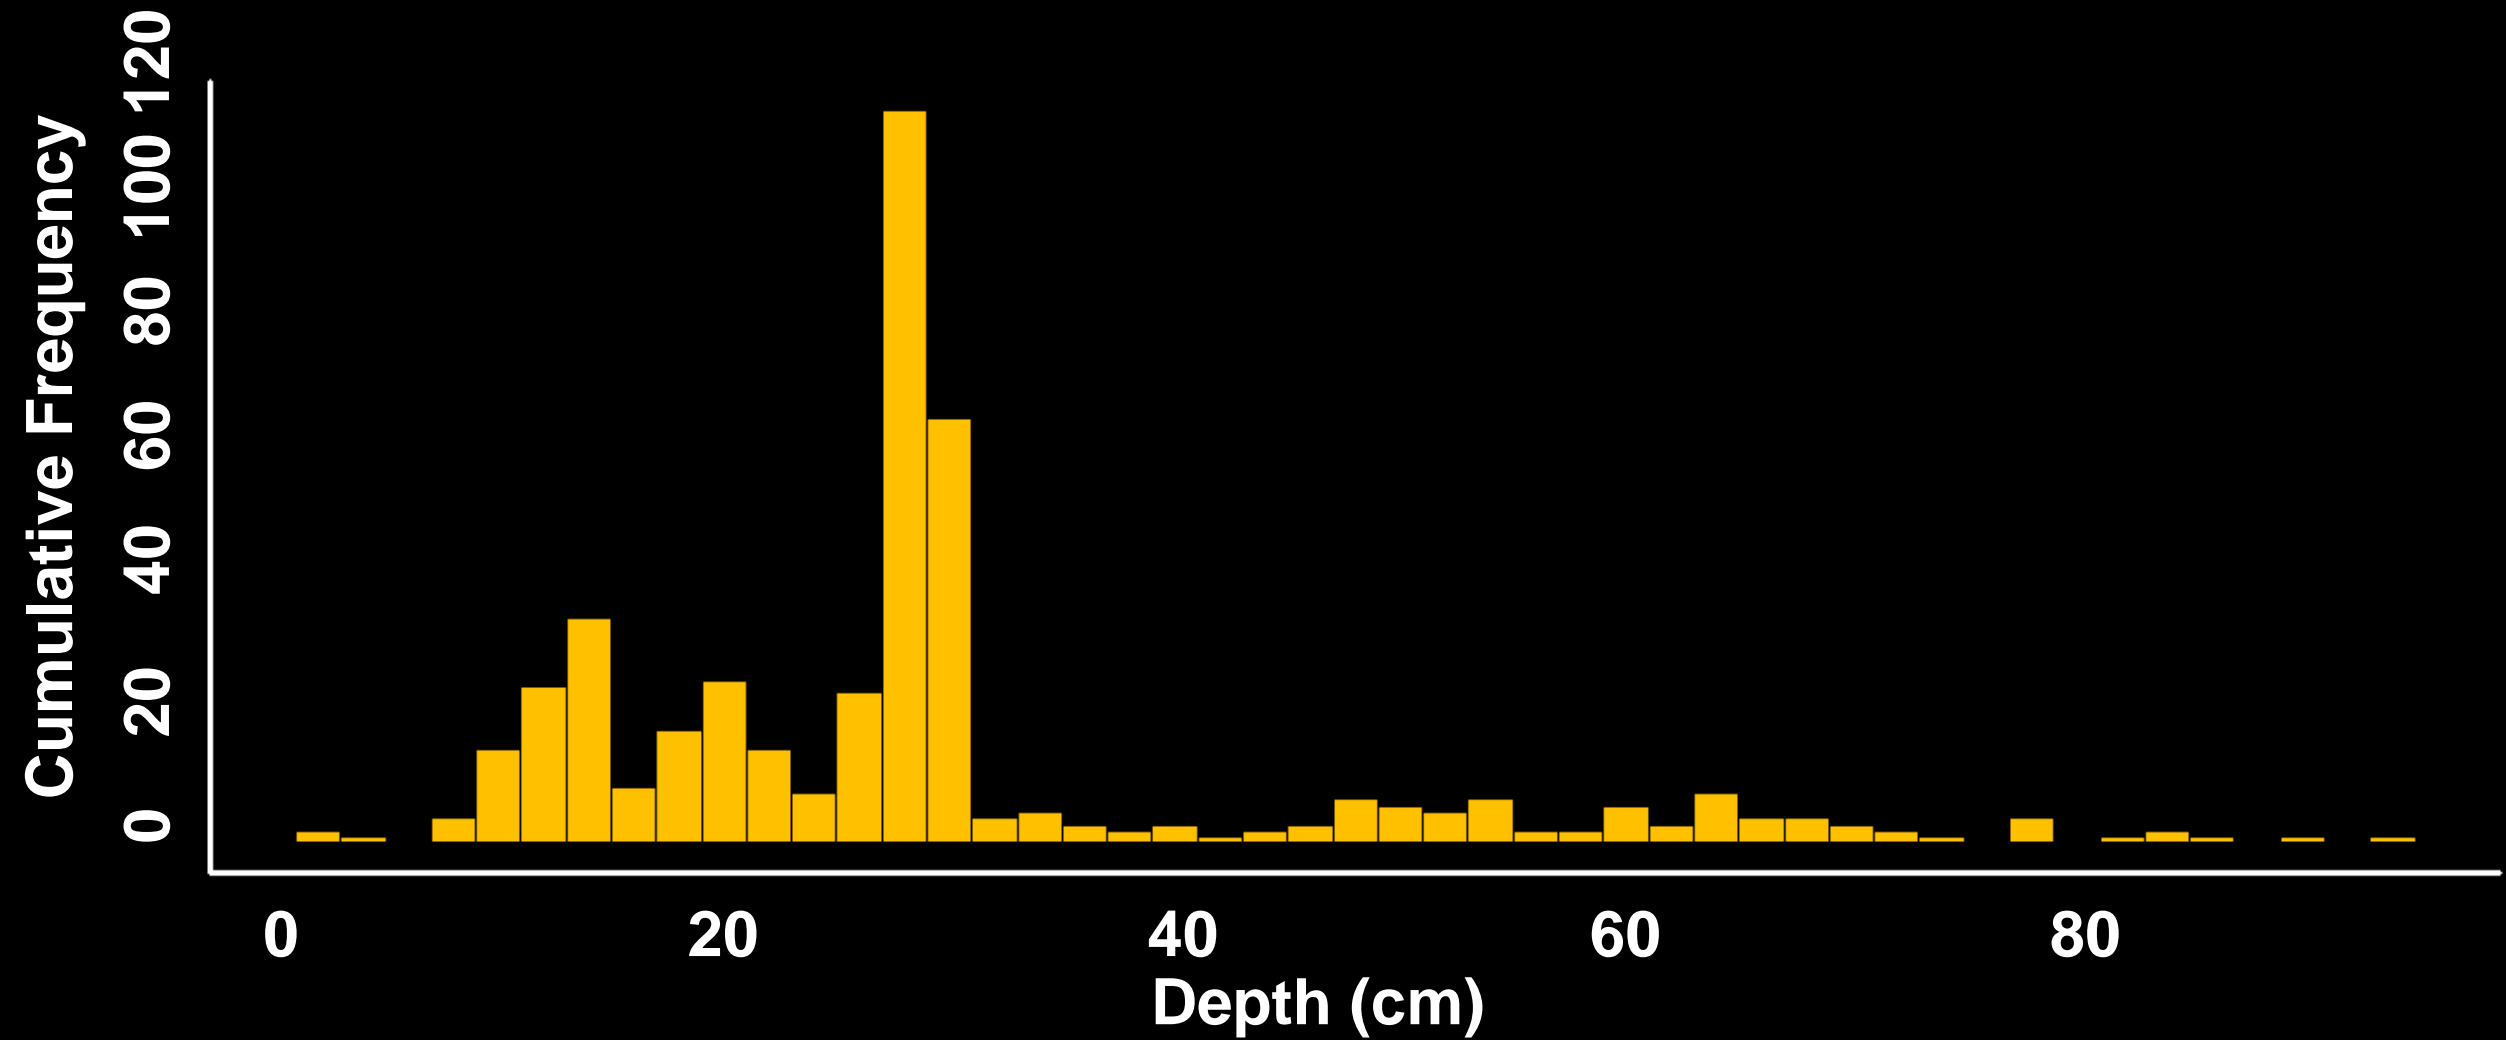

- Literature on depth, water velocity, and substrate size
- Data then used to generate suitability curves
- Compared field data to suitability curves for each
- Generation variability and predicted suitability

Generally the best predictive models are constructed with data from the system

So.....

Generally the best predictive models are constructed with data from the system

So.....

What if we want to develop a predictive model with data from the GFTW?

Measured at Redds

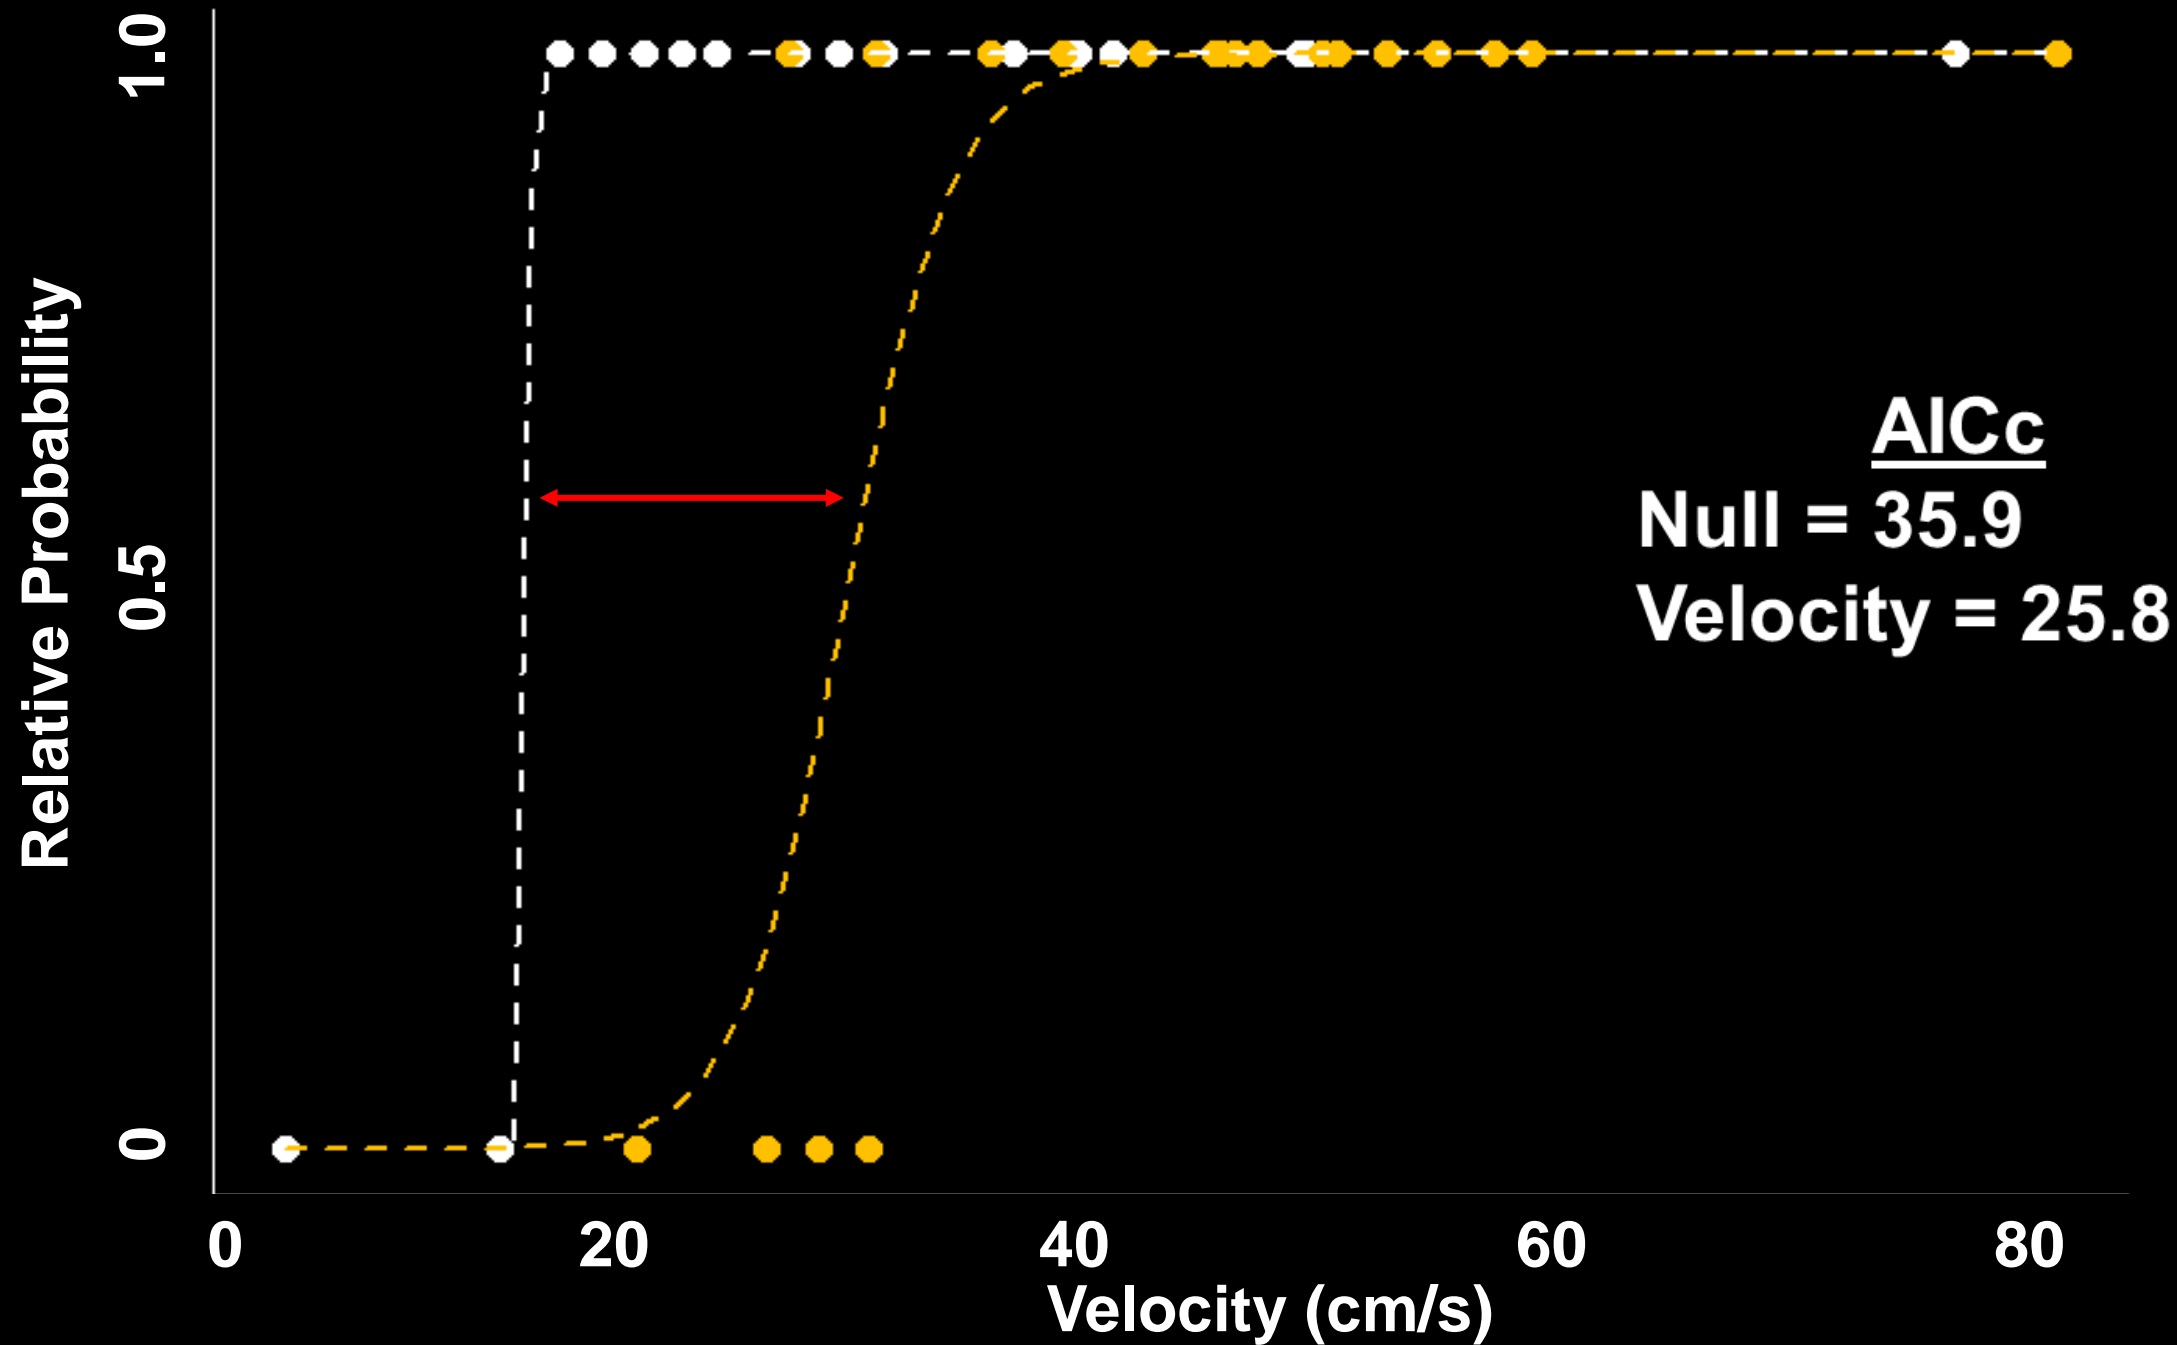

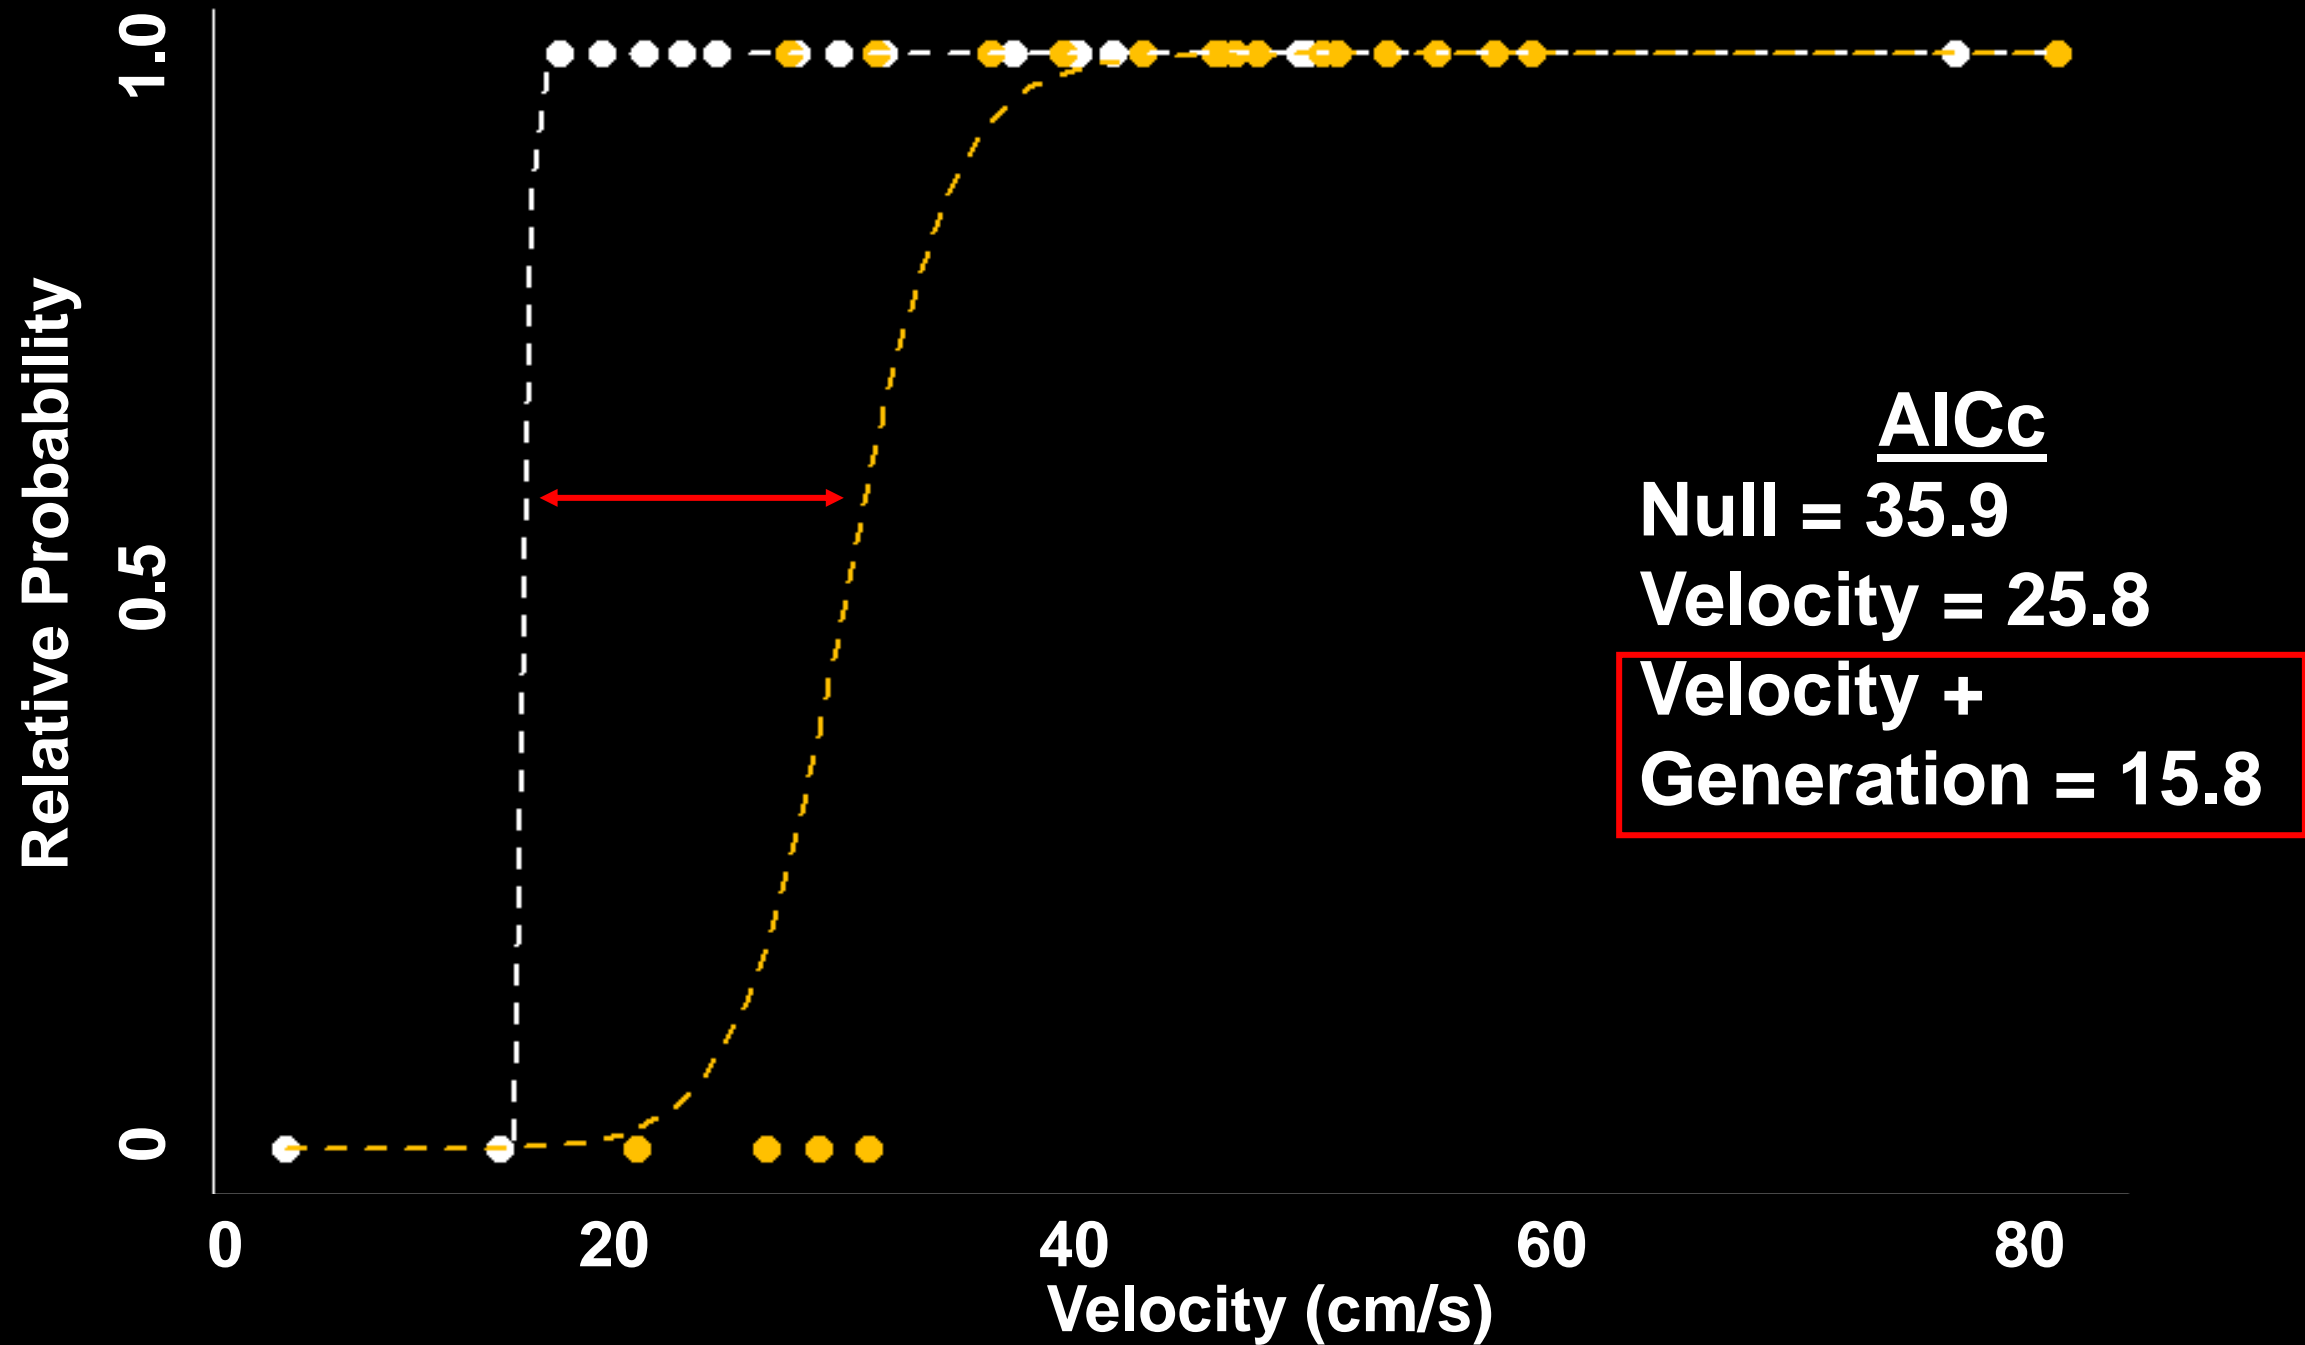

Future Work

- **Monitor hatch and emergence times**
- **Generalized suitability curve work and testing**
- **Comparison of field measurement metrics**
- **Data collection at higher water levels and flows**

Conclusion

- **Spawn time variable between tailwaters**
- **Generalized suitability curves apply to GFTW**
- **Water velocity appears to drive redd presence**
- **Generation affects predictive modeling**
